## HELIOS RENEWABLE ENERGY PROJECT – PEIR CALCULATIONS JULY 2023

## Headline Text

The installed capacity for the site is expected to be around 250 MWp (Direct Current – DC) with an export capacity of 190 MW (Alternating Current – AC). Using the 190 MW as a conservative approach, the annual generation for a solar farm of this size could generate approximately 176 gigawatt-hours (GWh) of renewable electricity per year.

Capacity factor, or load factor, is a term often used to consider the performance of solar farms, and other generation sources. The capacity factor is how much electricity a site generates a year compared to how much electricity could theorectically have been generated if it were producing at maximum output continuously. In this case a capacity factor of 10.6% has been used in line with the latest figures released by the Department for Business, Energy & Industrial Strategy for UK solar photovoltaic projects. The estimated carbon dioxide (CO<sub>2</sub>) savings are approximately 36,558 tonnes of CO<sub>2</sub> per year.

## **Supporting Calculations**

Site	Figure	Calculation	Source
Solar Farm capacity (MW)	190	N/A.	N/A.
Site Specific [UK] capacity factor	10.6%	N/A.	Assumes a capacity factor of 10.6% for average UK solar
			photovoltaic projects as per the 'Digest of UK Energy Statistics
			(DUKES) 2022: Chapter 5', published by the Department for
			Business, Energy & Industrial Strategy. See Table 6.3 "Load
			Factor". Updated 27 July 2023.
